

## Communications Spacers

PREFORMED™ Communication Spacers provide a sure, inexpensive way of eliminating mid-span hits on open wire. Contacts in the span between wires of an open line cause troubles reported as “line goes dead” and momentary shorts and crosses. Communication Spacers keep open wires uniformly in their place. Applied to parallel or converging lines, they maintain spacing required between adjacent open wires. Helically-formed legs assure absolute uniformity of each application.

PREFORMED™ Communication Spacers are made of a rigid, solid 12,5 mm, high impact, polyvinyl chloride, possessing excellent chemical strength properties. Outdoor aging data indicates the material does not deteriorate in function or appearance from severe weather conditions. Industrial fumes and salt water cannot seriously degrade rigid vinyl properties. Communication Spacers are designed with an inside diameter suitable for direct application to mid-span locations. Spacers are easily wrapped on to adjacent wires by hand, without tools, in seconds.
